## Lecture 7. Outline.

- 1. Isoperimetric inequality for hypercube.
- 2. Modular Arithmetic. Clock Math!!!
- 3. Inverses for Modular Arithmetic: Greatest Common Divisor. Division!!!
- 4. Euclid's GCD Algorithm. A little tricky here!

## Isoperimetry.

For 3-space:

The sphere minimizes surface area to volume.

Surface Area:  $4\pi r^2$ , Volume:  $\frac{4}{3}\pi r^3$ .

Ratio:  $1/3r = \Theta(V^{-1/3})$ .

Graphical Analog: Cut into two pieces and find ratio of edges/vertices on small side.

Tree:  $\Theta(1/|V|)$ .

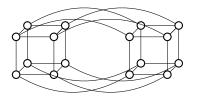

Hypercube:  $\Theta(1)$ .

Surface Area is roughly at least the volume!

## **Recursive Definition.**

A 0-dimensional hypercube is a node labelled with the empty string of bits.

An *n*-dimensional hypercube consists of a 0-subcube (1-subcube) which is a n-1-dimensional hypercube with nodes labelled 0x(1x) with the additional edges (0x, 1x).

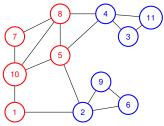

## Hypercube: Can't cut me!

**Thm:** Any subset *S* of the hypercube where  $|S| \le |V|/2$  has  $\ge |S|$  edges connecting it to V - S;  $|E \cap S \times (V - S)| \ge |S|$ 

Terminology: (S, V - S) is cut.  $(E \cap S \times (V - S))$  - cut edges.

Restatement: for any cut in the hypercube, the number of cut edges is at least the size of the small side.

# Cuts in graphs.

S is red, V - S is blue.

What is size of cut?

Number of edges between red and blue. 4.

Hypercube: any cut that cuts off *x* nodes has  $\ge x$  edges.

## Proof of Large Cuts.

**Thm:** For any cut (S, V - S) in the hypercube, the number of cut edges is at least the size of the small side. **Proof:** 

Base Case: n = 1 V= {0,1}. S = {0} has one edge leaving.  $|S| = \phi$  has 0.

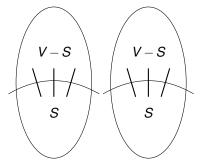

# Induction Step Idea

**Thm:** For any cut (S, V - S) in the hypercube, the number of cut edges is at least the size of the small side.

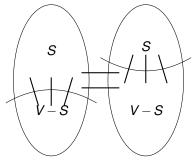

Use recursive definition into two subcubes.

Two cubes connected by edges.

Case 1: Count edges inside subcube inductively.

# **Induction Step**

**Thm:** For any cut (S, V - S) in the hypercube, the number of cut edges is at least the size of the small side, |S|.

#### **Proof: Induction Step.**

Recursive definition:

 $H_0 = (V_0, E_0), H_1 = (V_1, E_1)$ , edges  $E_x$  that connect them.  $H = (V_0 \cup V_1, E_0 \cup E_1 \cup E_x)$ 

 $S = S_0 \cup S_1$  where  $S_0$  in first, and  $S_1$  in other.

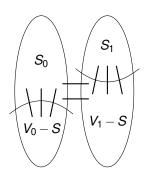

Case 1:  $|S_0| \le |V_0|/2, |S_1| \le |V_1|/2$ Both  $S_0$  and  $S_1$  are small sides. So by induction. Edges cut in  $H_0 \ge |S_0|$ . Edges cut in  $H_1 \ge |S_1|$ .

 $\label{eq:constraint} \text{Total cut edges} \geq |\textbf{\textit{S}}_0| + |\textbf{\textit{S}}_1| = |\textbf{\textit{S}}|.$ 

## Induction Step. Case 2.

**Thm:** For any cut (S, V - S) in the hypercube, the number of cut edges is at least the size of the small side, |S|.

Proof: Induction Step. Case 2.

$$\begin{split} |S_0| &\geq |V_0|/2. \\ \text{Recall Case 1: } |S_0|, |S_1| &\leq |V|/2 \\ |S_1| &\leq |V_1|/2 \text{ since } |S| &\leq |V|/2. \\ &\implies &\geq |S_1| \text{ edges cut in } E_1. \\ |S_0| &\geq |V_0|/2 \implies |V_0 - S| &\leq |V_0|/2 \\ &\implies &\geq |V_0| - |S_0| \text{ edges cut in } E_0. \end{split}$$

Edges in  $E_x$  connect corresponding nodes.  $\implies = |S_0| - |S_1|$  edges cut in  $E_x$ .

Total edges cut:

 $\geq |S_1| + |V_0| - |S_0| + |S_0| - |S_1| = |V_0| \\ |V_0| = |V|/2 \geq |S|.$ Also, case 3 where  $|S_1| \geq |V|/2$  is symmetric.

# Hypercube proof: poll

### Hypercube has large cuts proof uses these ideas:

(A) If cuts are same size on two sides it works by induction.

- (B) Uses the fact that it is planar.
- (C) Recursive definition of hypercube.
- (D) If different size, can count edges between to subcubes.
- (E) Applies Euler's formula.

(A),(D), and (E).

## Hypercubes and Boolean Functions.

The cuts in the hypercubes are exactly the transitions from 0 sets to 1 set on boolean functions on  $\{0,1\}^n$ .

Central area of study in computer science!

Yes/No Computer Programs  $\equiv$  Boolean function on  $\{0,1\}^n$ 

Central object of study.

## Modular Arithmetic.

Applications: cryptography, error correction.

## Key ideas for modular arithmetic.

Theorem: If d|x and d|y, then d|(y-x).

Proof: x = ad, y = bd, $(x - y) = (ad - bd) = d(a - b) \implies d|(x - y).$ 

Theorem: Every number  $n \ge 2$  can be represented as a product of primes.

Proof: Either prime, or  $n = a \times b$ , and use strong induction. (Uniqueness? Later.)

## Poll

### What did we use in our proofs of key ideas?

- (A) Distributive Property of multiplication over addition.
- (B) Euler's formula.
- (C) The definition of a prime number.
- (D) Euclid's Lemma.
- (A) and (C)

## Next Up.

Modular Arithmetic.

## **Clock Math**

If it is 1:00 now. What time is it in 2 hours? 3:00! What time is it in 5 hours? 6:00! What time is it in 15 hours? 16:00! Actually 4:00.

16 is the "same as 4" with respect to a 12 hour clock system. Clock time equivalent up to to addition/subtraction of 12.

What time is it in 100 hours? 101:00! or 5:00.

 $101 = 12 \times 8 + 5.$ 

5 is the same as 101 for a 12 hour clock system. Clock time equivalent up to addition of any integer multiple of 12.

Custom is only to use the representative in  $\{12, 1, ..., 11\}$ (Almost remainder, except for 12 and 0 are equivalent.)

## Day of the week.

This is Thursday is February 11, 2021. What day is it a year from then? on February 11, 2022? Number days.

0 for Sunday, 1 for Monday, ..., 6 for Saturday.

Today: day 4.

5 days from then. day 9 or day 2 or Tuesday. 25 days from then. day 29 or day 1. 29 = (7)4 + 1two days are equivalent up to addition/subtraction of multiple of 7. 11 days from then is day 1 which is Monday!

What day is it a year from then?

Next year is not a leap year. So 365 days from then.

Day 4+365 or day 369.

Smallest representation:

subtract 7 until smaller than 7.

divide and get remainder.

369/7 leaves quotient of 52 and remainder 5. 369 = 7(52) + 5

or February 11, 2022 is a Friday.

```
Years and years...
```

```
80 years? 20 leap years. 366 \times 20 days
60 regular years. 365 \times 60 days
Today is day 4.
It is day 4 + 366 \times 20 + 365 \times 60. Equivalent to?
```

Hmm.

What is remainder of 366 when dividing by 7?  $52 \times 7 + 2$ . What is remainder of 365 when dividing by 7? 1 Today is day 4.

Get Day:  $4+2 \times 20+1 \times 60 = 104$ Remainder when dividing by 7?  $104 = 14 \times 7 + 6$ . Or February 11, 2101 is Saturday!

Further Simplify Calculation:

20 has remainder 6 when divided by 7.

60 has remainder 4 when divided by 7.

Get Day:  $2 + 2 \times 6 + 1 \times 4 = 18$ .

Or Day 6. February 11, 2101 is Saturday.

"Reduce" at any time in calculation!

## Modular Arithmetic: refresher.

*x* is congruent to *y* modulo *m* or " $x \equiv y \pmod{m}$ " if and only if (x - y) is divisible by *m*. ...or *x* and *y* have the same remainder w.r.t. *m*. ...or x = y + km for some integer *k*.

Mod 7 equivalence classes:

 $\{\ldots,-7,0,7,14,\ldots\} \ \{\ldots,-6,1,8,15,\ldots\} \ \ldots$ 

**Useful Fact:** Addition, subtraction, multiplication can be done with any equivalent *x* and *y*.

or "
$$a \equiv c \pmod{m}$$
 and  $b \equiv d \pmod{m}$   
 $\implies a+b \equiv c+d \pmod{m}$  and  $a \cdot b = c \cdot d \pmod{m}$ "

**Proof:** If  $a \equiv c \pmod{m}$ , then a = c + km for some integer k. If  $b \equiv d \pmod{m}$ , then b = d + jm for some integer j. Therefore, a+b = c+d+(k+j)m and since k+j is integer.  $\implies a+b \equiv c+d \pmod{m}$ .

Can calculate with representative in  $\{0, \ldots, m-1\}$ .

# Notation

x (mod m) or mod (x, m) - remainder of x divided by m in {0,...,m-1}. mod (x, m) = x -  $\lfloor \frac{x}{m} \rfloor m$   $\lfloor \frac{x}{m} \rfloor$  is quotient. mod (29, 12) = 29 - ( $\lfloor \frac{29}{12} \rfloor$ ) × 12 = 29 - (2) × 12 = X = 5Work in this system.

 $a \equiv b \pmod{m}$ .

Says two integers a and b are equivalent modulo m.

### Modulus is m

 $6 \equiv 3 + 3 \equiv 3 + 10 \pmod{7}$ .

 $6 = 3 + 3 = 3 + 10 \pmod{7}$ .

Generally, not 6 (mod 7) = 13 (mod 7).

But probably won't take off points, still hard for us to read.

## Inverses and Factors.

Division: multiply by multiplicative inverse.

$$2x = 3 \implies \left(\frac{1}{2}\right) \cdot 2x = \left(\frac{1}{2}\right) \cdot 3 \implies x = \frac{3}{2}.$$

Multiplicative inverse of x is y where xy = 1; 1 is multiplicative identity element.

In modular arithmetic, 1 is the multiplicative identity element.

**Multiplicative inverse of**  $x \mod m$  is y with  $xy = 1 \pmod{m}$ .

For 4 modulo 7 inverse is 2:  $2 \cdot 4 \equiv 8 \equiv 1 \pmod{7}$ .

```
Can solve 4x = 5 \pmod{7}.

x = 3 \pmod{2} (mod 7).

For 8 Modulo (2?967) multiplicative inverse!

x = 3 \pmod{7}

"Check 4.13 (mod 7).

8k - 12\ell is a multiple of four for any \ell and k \implies

8k \neq 1 \pmod{12} for any k.
```

## Poll

#### Mark true statements.

(A) Mutliplicative inverse of 2 mod 5 is 3 mod 5.

- (B) The multiplicative inverse of  $((n-1) \pmod{n} = ((n-1) \pmod{n})$ .
- (C) Multiplicative inverse of 2 mod 5 is 0.5.
- (D) Multiplicative inverse of  $4 = -1 \mod 5$ .
- (E) (-1)x(-1) = 1. Woohoo.

(F) Multiplicative inverse of 4 mod 5 is 4 mod 5.

(C) is false. 0.5 has no meaning in arithmetic modulo 5.

## Greatest Common Divisor and Inverses.

### Thm:

If greatest common divisor of x and m, gcd(x, m), is 1, then x has a multiplicative inverse modulo m.

**Proof**  $\implies$ : **Claim:** The set  $S = \{0x, 1x, \dots, (m-1)x\}$  contains  $y \equiv 1 \mod m$  if all distinct modulo m.

Each of *m* numbers in *S* correspond to one of *m* equivalence classes modulo *m*.

 $\implies$  One must correspond to 1 modulo *m*. Inverse Exists!

Proof of Claim: If not distinct, then  $\exists a, b \in \{0, ..., m-1\}$ ,  $a \neq b$ , where  $(ax \equiv bx \pmod{m}) \implies (a-b)x \equiv 0 \pmod{m}$ Or (a-b)x = km for some integer k.

gcd(x,m) = 1

⇒ Prime factorization of *m* and *x* do not contain common primes. ⇒ (a-b) factorization contains all primes in *m*'s factorization. So (a-b) has to be multiple of *m*.

 $\implies$   $(a-b) \ge m$ . But  $a, b \in \{0, ..., m-1\}$ . Contradiction.

## Proof review. Consequence.

**Thm:** If gcd(x, m) = 1, then x has a multiplicative inverse modulo m.

**Proof Sketch:** The set  $S = \{0x, 1x, ..., (m-1)x\}$  contains  $y \equiv 1 \mod m$  if all distinct modulo *m*.

For x = 4 and m = 6. All products of 4...  $S = \{0(4), 1(4), 2(4), 3(4), 4(4), 5(4)\} = \{0, 4, 8, 12, 16, 20\}$ reducing (mod 6)  $S = \{0, 4, 2, 0, 4, 2\}$ 

Not distinct. Common factor 2. Can't be 1. No inverse.

For x = 5 and m = 6.  $S = \{0(5), 1(5), 2(5), 3(5), 4(5), 5(5)\} = \{0, 5, 4, 3, 2, 1\}$ All distinct, contains 1! 5 is multiplicative inverse of 5 (mod 6). (Hmm. What normal number is it own multiplicative inverse?) 1 -1.

 $5x = 3 \pmod{6}$  What is x? Multiply both sides by 5. x =  $15 = 3 \pmod{6}$ 

 $4x = 3 \pmod{6}$  No solutions. Can't get an odd.  $4x = 2 \pmod{6}$  Two solutions!  $x = 2,5 \pmod{6}$ 

Very different for elements with inverses.

## Proof Review 2: Bijections.

If gcd(x,m) = 1. Then the function  $f(a) = xa \mod m$  is a bijection. One to one: there is a unique pre-image. Onto: the sizes of the domain and co-domain are the same. x = 3, m = 4.  $f(1) = 3(1) = 3 \pmod{4}, f(2) = 6 = 2 \pmod{4}, f(3) = 1 \pmod{3}.$ Oh yeah. f(0) = 0.

Bijection  $\equiv$  unique pre-image and same size.

All the images are distinct.  $\implies$  unique pre-image for any image.

$$x = 2, m = 4.$$
  
 $f(1) = 2, f(2) = 0, f(3) = 2$   
Oh yeah.  $f(0) = 0.$ 

Not a bijection.

## Poll

#### Which is bijection?

### (A) f(x) = x for domain and range being $\mathbb{R}$ (B) f(x) = axmod(n) for $x \in \{0, ..., n-1\}$ and gcd(a, n) = 2(C) f(x) = axmodn for $x \in \{0, ..., n-1\}$ and gcd(a, n) = 1(B) is not.

# Only if

Thm: If  $gcd(x,m) \neq 1$  then x has no multiplicative inverse modulo m. Assume a is  $x^{-1}$ , or ax = 1 + km. x = nd and  $m = \ell d$  for d > 1. Thus,  $a(nd) = 1 + k\ell d$  or  $d(na - k\ell) = 1$ . But d > 1 and  $n = (na - k\ell) \in \mathbb{Z}$ .

so  $dn \neq 1$  and dn = 1. Contradiction.

## Finding inverses.

How to find the inverse?

How to find if x has an inverse modulo m?

Find gcd (x, m).

Greater than 1? No multiplicative inverse.

Equal to 1? Mutliplicative inverse.

Algorithm: Try all numbers up to x to see if it divides both x and m. Very slow.

## Inverses

Next up.

Euclid's Algorithm. Runtime. Euclid's Extended Algorithm.

## Refresh

Does 2 have an inverse mod 8? No. Any multiple of 2 is 2 away from 0+8k for any  $k \in \mathbb{N}$ . Does 2 have an inverse mod 9? Yes. 5  $2(5) = 10 = 1 \mod 9$ . Does 6 have an inverse mod 9? No. Any multiple of 6 is 3 away from 0+9k for any  $k \in \mathbb{N}$ . 3 = gcd(6,9)!*x* has an inverse modulo *m* if and only if

gcd(x,m) > 1? No. gcd(x,m) = 1? Yes.

Now what?:

Compute gcd!

Compute Inverse modulo *m*.

## Divisibility...

**Notation:** d|x means "*d* divides *x*" or x = kd for some integer *k*.

**Fact:** If d|x and d|y then d|(x+y) and d|(x-y).

Is it a fact? Yes? No?

**Proof:** d|x and d|y or  $x = \ell d$  and y = kd

 $\implies x - y = kd - \ell d = (k - \ell)d \implies d|(x - y)$ 

## More divisibility

**Notation:** d|x means "*d* divides *x*" or x = kd for some integer *k*.

**Lemma 1:** If d|x and d|y then d|y and  $d| \mod (x, y)$ .

Proof:

Therefore  $d \mod (x, y)$ . And d | y since it is in condition.

**Lemma 2:** If d|y and  $d| \mod (x, y)$  then d|y and d|x. **Proof...:** Similar. Try this at home.

**GCD Mod Corollary:** gcd(x, y) = gcd(y, mod(x, y)). **Proof:** *x* and *y* have **same** set of common divisors as *x* and mod (x, y) by Lemma 1 and 2. Same common divisors  $\implies$  largest is the same. ⊡ish.

## Euclid's algorithm.

## **GCD Mod Corollary:** gcd(x, y) = gcd(y, mod(x, y)).

Hey, what's gcd(7,0)? 7 since 7 divides 7 and 7 divides 0 What's gcd(x,0)? x

```
(define (euclid x y)
  (if (= y 0)
        x
        (euclid y (mod x y)))) ***
```

**Theorem:** (euclid x y) = gcd(x, y) if  $x \ge y$ .

**Proof:** Use Strong Induction. **Base Case:** y = 0, "*x* divides *y* and *x*"  $\implies$  "*x* is common divisor and clearly largest." **Induction Step:** mod  $(x, y) < y \le x$  when  $x \ge y$ call in line (\*\*\*) meets conditions plus arguments "smaller" and by strong induction hypothesis computes gcd(*y*, mod (*x*, *y*)) which is gcd(*x*, *y*) by GCD Mod Corollary.

## Modular Arithmetic Lecture in a minute.

Modular Arithmetic:  $x \equiv y \pmod{N}$  if x = y + kN for some integer k.

For 
$$a \equiv b \pmod{N}$$
, and  $c \equiv d \pmod{N}$ ,  
 $ac = bd \pmod{N}$  and  $a+b=c+d \pmod{N}$ 

Division? Multiply by multiplicative inverse.  $a \pmod{N}$  has multiplicative inverse,  $a^{-1} \pmod{N}$ . If and only if gcd(a, N) = 1.

Why? If: 
$$f(x) = ax \pmod{N}$$
 is a bijection on  $\{1, ..., N-1\}$ .  
 $ax - ay = 0 \pmod{N} \implies a(x - y)$  is a multiple of *N*.  
If  $gcd(a, N) = 1$ ,  
then  $(x - y)$  must contain all primes in prime factorization of *N*,

and is therefore be bigger than N.

Only if: For 
$$a = xd$$
 and  $N = yd$ ,

any ma + kN = d(mx - ky) or is a multiple of d, and is not 1.

Euclid's Alg: 
$$gcd(x,y) = gcd(y \mod x,x)$$
  
Fast cuz value drops by a factor of two every two recursive calls.

Know if there is an inverse, but how do we find it? On Tuesday!
